# Introduction

The PCM-53E52 is a compact Half-EBX board with PC/104Plus, SSD, Ethernet, and four COM ports. Unlike other compact Half-EBX boards, the PCM-53E52 has an optional Analog and Digital I/O Daughter Board, allowing for data acquisition and greater flexibility.

The PCM-53E52 features a low power AMD® ELAN-SC520 133Mhz processor (no fan required, PR120 equiv.). This compact Half-EBX board has on board, 16MB of SDRAM memory standard. A 32MB to 128MB memory upgrade option is also available as is a DiskOnChip® 2000 (DOC) solid state flash disk (no moving parts). The PCM-53E52 can be connected onto a network using the Realtek® RTL8139C 10/100Base-T Ethernet controller and onboard RJ-45 connector. In addition, the PC/104Plus connectors provide both ISA and PCI connectivity.

The PCM-53E52 offers three RS-232 serial ports, one RS-232/422/485 serial port, and a parallel port that supports SPP/EPP/ECP parallel modes. This board includes a mini-DIN keyboard/mouse connector, an onboard 34-pin FDD interface that supports two floppy disk drives, and an onboard 44-pin EIDE interface that supports two EIDE devices. The PCM-53E52 is 5.75" in length and 4" wide, making it a great fit for harsh environment and limited-space applications.

The optional Analog and Digital I/O Daughter Board adds micro-controller capability with the power of a PC. The I/O daughter board includes 16, General Purpose I/O lines and eight high current sink outputs on a standard I/O Rack compatible 50 pin header. This board also includes: 16 channels of A/D with 10 or12-bit resolution, and four channels of D/A with 12-bit resolution. In addition, the I/O daughter board supports up to a 24-key keypad and is capable of driving up to a 40 x 4 character and graphic LCD displays.

# **Features**

### Single Board Computer

- Compact size (145 mm x 102 mm). Fits in the space of a 3 1/2" HDD
- ISA and PCI bus expansion with onboard PC/104Plus connector
- Onboard ELAN SC520 133MHz embedded microprocessor
- Supports M-Systems' DiskOnChip® 2000 Flash memory
- Onboard 10/100 Base-T Ethernet interface
- Supports onboard 16MB SDRAM memory
- Onboard mini-DIN PS/2 keyboard/ mouse connector
- Built-in Enhanced IDE hard disk drive interface, floppy disk interface and parallel port
- Four serial ports: three RS-232 and one RS-422/485; on-board DB-9 connector is designated as COM1
- Single +5 V power supply
- Flexible OEM/ODM design

### PCD-E12 I/O Daughter Board Option

- Motorola HS12 processor
- 16 Channels of 10 bit A/D, 0 to 5 volt.
- 24 Digital I/O lines in a standard 50 pin I/O Rack compatible header.
  - 8 are high current sink outputs which also have 8 bit resolution PWM capability.
  - 8 have 16 bit resolution PWM capability.
- 1 RS232 port.
- 1 CAN 2.0B port.
- 24 Key, Keypad interface for decoding 3x4, 4x4, 5x4 or 6x4 matrix keypads.
- 8 bit Character/Graphic LCD interface.
- Status LED.

### PCD-E12 On-board Options

- 8 Channels of 12 bit A/D, 0 to 5 volt replaces 8 channels of 10 bit.
- 4 Channels of 12 bit D/A, 0 to 5 volt.
- RS-422/485 serial port

For Further information on the PCD-E12 please see the PCD-E12 Manual.

# **Specifications**

### Standard SBC functions

- CPU: Onboard ELAN SC520 133MHz embedded microprocessor
- BIOS: General Software
- RAM: Onboard 16MB SDRAM standard and 32MB to 128MB options
- Enhanced IDE HDD interface: Supports up to two Enhanced IDE devices.
- FDD interface: Supports up to two FDDs
  - 5.25" (360KB and 1.2MB) and/or
  - 3.5" (720KB, 1.44MB, and 2.88MB)
- Parallel port: One parallel port supports SPP/EPP/ECP parallel modes
- Serial ports: Three RS-232 ports, one RS-422/485 port
- PC/104Plus expansion: 16-bit and 32-bit PC/104 module connectors
- Keyboard/mouse connector: Mini-DIN connector for keyboard and PS/2 mouse

### Solid State Disk

• Supports DiskOnChip® 2000: up to 288 MB Flash memory

### Ethernet interface

- Ethernet chipset: Realtek RTL8139C
- Ethernet type: 10/100Base-T Ethernet controller
- Ethernet connection: On-board RJ-45 connector

### PCD-E12 I/O Daughter Board (additional specifications to added)

- 16 Channels of 10 bit A/D, 0 to 5 volt.
- 24 Digital I/O lines with 8 high drive outs.
- 1 RS232 port with handshake (1 in/1 out).
- 1 CAN 2.0B port.
- 24 Key, keypad interface (4x6 matrix).
- 8 bit Character/Graphic or 4 bit Character LCD interface.
- Status LED.
- Optional 8 Channels of 12 bit A/D, 0 to 5 volt which replaces 8 channels of 10 bit.
- Optional 4 Channels of 12 bit D/A, 0 to 5 volt.

### Mechanical and environmental

- Dimensions: 145mm x 102mm
- Weight: 0.17kg (0.37lbs)
- Power Supply Voltage: +5V (4.57 ~ 5.25V)
- Power Requirements: +5V @ 1.0 A (typical)
- Operating Temperature: 0 ~ 60° C (32 ~ 140° F)

# **Packing List**

### Packing List for standard PCM-53E52 SBC:

- 1 PCM-53E52 SBC Board
- 1 IDE cable 18" 40 pin cable
- 2 Serial header Cables 10 pin female header to male DB9
- 1 Parallel port cable 26 pin female header to male DB25
- 1 Standard floppy cable 34 pin cable with 3 connectors 34 pin connectors

The following cable is optional:

Keyboard/Mouse PS/2 Y cable {This cable is required to have access to the PS/2 mouse port.}

This cable is available from EMAC, Inc. under the following part numbers: For AT Keyboards CAB-50-001-1 For PS/2 Keyboards CAB-50-002-1

### Packing List for standard PCD-E12 I/O daughter board

- 1 PCD-E12 I/O daughter board
- 1 Serial header Cables 10 pin female header to male DB9
- 1 Bag of mounting hardware

Optional for boards with Can interface option:

1 Can interface header – 10 pin female header to female DB9

# PCM-53E52 Configuration

### **Jumper & Connector Descriptions**

The PCM-53E52 comes factory configured and ready to operate. In the event that jumpers need to be verified or modified this section provides the information required, including instructions on setting jumpers and connecting peripherals, switches and indicators. Be sure to read all the safety precautions before you begin any configuration procedure. See Appendix A for connector pin-outs and Appendix B for Jumper Settings.

### Table 1 Jumpers

Label	Function
JP1	Processor Run Mode
JP2	AMD Debug Mode
JP3	CMOS Setup Clear Jumper & Real-Time Clock Reset
JP4	Com2 Mode (RS232 or RS422/485)

### **Table 2 Connectors**

Label	Function	
CN1	Com 1	
CN2	Com 2	

### **Table 3 Headers**

Label	Function	
HDR1	JTAG Interface	
HDR2	40 Pin IDE header	
HDR3	Printer Port	
HDR4	Com 4	
HDR5	Floppy drive connector	
HDR6	Power	
HDR7	Com 3	

### **Table 4 Jacks**

Label	Function
JK1	Ethernet interface
JK2	Keyboard/Mouse

### Table 5 Sockets

Label	Function
SOK1	BIOS chip holder
SOK2	DOC Socket

### Table 6 LEDs

Label	Function
LD1	Hard Drive Activity
LD2	Ethernet Link & Activity
LD3	Power LED

### **Determining Board Configuration**

The board number can be used to determine what options are populated. For example: PCM-53E52-010-1 is a Rev. 1 board with 32MB of ram, Ethernet, PC/104+, and all Cables.

This is found by decoding the 3 numbers after the board number designator.

How to decode the part numbers: X0X is the standard 16MB of onboard memory X1X is the upgrade to 32MB of onboard memory X2X is the upgrade to 64MB of onboard memory X3X is the upgrade to 128MB of onboard memory

0XX is used for OEM or Product Designator, 0 for Products (includes all cables and options), 1 for OEM boards sold as non standard parts many not include all of the cables or onboard features.

XX0 is a reserved designator

-1 is the designator for the board Revision number

### Determining How Much Memory is Onboard

The following information is to help assist in calculating how much ram your board has on it.

This information pertains to the onboard chips U4 and U5: 16meg system =2pcs of (8mB) 4 Meg x 16 Quad bank, 3.3V-- MT48LC4M16A2TG-75 32meg system =2pcs of (16mB) 8 Meg x 16 Quad bank, 3.3V-- MT48LC8M16A2TG-75 64meg system =2pcs of (32mB) 16 Meg x 16 Quad bank, 3.3V-- MT48LC16M16A2TG-75 128meg system =2pcs of (32mB) 32 Meg x 16 Quad bank, 3.3V-- MT48LC32M16A2TG-75

These part numbers are Micron Technology parts and may be substituted with equivalent chips by another manufacturer.

If you have any questions about the configuration of the board you have please email: <a href="mailto:support@emacinc.com">support@emacinc.com</a>

# Powering Up the PCM-53E52

Cianal

The PCM-53E52's power connector (CN1) is a standard floppy, four-pin type connector commonly found on most PC type power supplies. The PCM-53E52's logic only requires 5 volts DC. The 12v pin (HDR6 pin 4) is routed to the PC/104 connectors and may be used by some PC/104 expansion cards. The pin-out for the HDR6 power connector is as follows:

	ГШ	Signal
	1	+5 V
	2	GND
	3	GND
	4	+12 V
	** Pin 1	is the pin closest to C1 on the topside of the board
		•
_		the new vertice we the DCM 52552 make avera the

# **Remember** before powering-up the PCM-53E52 make sure the DOC is correctly orientated, firmly seated and check any cables to make sure that plugged on and correctly in relation to pin 1.

**Note:** The PCM-53E52 requires less than 2 amps which is not enough current to load the main switcher in some larger PC power supplies (this can be verified with a voltmeter measuring the 5-volt supply). If this is the case you can try to load the power supply by adding 5-volt devices, or order a compatible power supply from EMAC.

### Ethernet

**D**:"

The PCM-53E52 utilizes the RTL 8139 10/100 BaseT full duplex Ethernet chip and terminates to a standard RJ-45 connector (JK1). It can be connected straight to a Hub, Switch or directly to another computer via a crossover Ethernet cable. Link and Activity (Rx/Tx) LEDs (LD2) are provided to monitor network activity.

### Serial Ports

The PCM-53E52 is equipped with four serial ports. All four serial ports are standard X86, 16550, 16 byte FIFO UARTS. Using the BIOS setup screen an alternate I/O addresses and IRQs can be selected for each of the serial ports.

COM1 is set to be RS232 and is configured by default to 3F8H using IRQ 4. Availability is via the DB9 (CN1) connector on the edge of the board.

COM2 is jumper configurable to run RS232 or RS422/485 and is set by default to I/O address 2F8H using IRQ 3. This comport is available via a DB9 connector (CN2). The mode is switched using JP4, if the jumper is present it will run RS422/485. To transmit using RS422/485, RTS must be asserted, the receiver is always active. By default the RS422/485 port is set up for full duplex, 4 wire communication. To use half duplex, 2 wire communication, simple connect TX+ to RX+ and TX- to RX-. Using the RS422/485 port in this manner allows the user to monitor all outgoing data as its being transmitted. This can be very helpful in two wire RS485 networks. Note: no provision has been made on the PCM-53E52 for a termination resistor. If one is required soldering a resistor(s) across the necessary pins on the mating DB9 is advised.

COM3 and COM4 are both configured as RS232 ports. These are available to the user on connectors HDR7 & HDR5 respectively. The default I/O address and IRQ for COM3 is 3E8H using IRQ 5 and the default I/O address for COM4 is 2E8H using IRQ 10.

NOTE: COM4 DOES NOT OFFER HANDSHAKING AND IS LIMITED TO RXD AND TXD DUE TO PIN FUNCTION TRADEOFFS AT THE SUPER I/O CHIP. SELECT FUNCTIONS FROM COM3 AND COM4 SHARED THRU ONE INTERFACE DRIVER CHIP.

### Keyboard/Mouse

The PCM-53E52 is equipped with a keyboard and mouse interface. Both the keyboard and the mouse utilize the same PS/2 connector (JK1) through the use of the included Y cable. Though a standard PS/2 keyboard can be plugged directly into the connector, to be able to use both a keyboard and mouse you must use the Y adapter cable or a serial mouse.

### Disk-On-Chip Flash Disk

The PCM-53E52 does not come with a DOC flash drive chip installed by default, but one can be ordered from EMAC and installed by the user or integrated at the time the PCM-53E52 is ordered.

The DOC is a solid state flash disk and as such is extremely rugged when compared to a conventional hard drive. The DOC is a paged memory device and is mapped at segment address D000 Hex by default, and by use of the device's firmware emulates a hard drive. Thus most operating systems will be able use the device similar to a hard drive. Using the BIOS setup screen an alternate DOC address can be selected if a conflict exists with an external device.

<u>Warning</u>: Be extremely careful when installing the DOC into its socket. Plugging it in backwards, and <u>turning on power</u>, can *destroy* the DOC and *damage* the PCM-53E52 rendering both inoperable! Any information on the DOC will be unrecoverable at this point.

Always double-check the orientation of the DOC when it has been removed from the board and reinserted, prior to turning the power back on.

### Parallel port

The PCM-53E52 comes with a Standard Parallel port interface, This is available to the user via a 26-pin header (HDR3) and included female DB25 cable. Using the BIOS setup screen alternate Parallel port operating modes can be selected.

### IDE connector

The PCM-53E52 is equipped with a standard IDE interface available to the user via the standard 40-pin header (HDR2) on the board. A standard hard drive cable is included.

### Floppy Drive connector

The PCM-53E52 is equipped to operate a standard 3.5" 1.44Mb floppy drive via the standard 34-Pin header (HDR5). A standard floppy drive cable is included. The floppy drive is enabled by default in the BIOS setup screen. If a floppy drive is not connected and extended timeout period will delay the system boot process. If a floppy drive is not connected to the PCM-53E52 it is recommended that drive boot order be changed in the BIOS setup screen.

### PCM-53E52 BIOS Defaults

The PCM-53E52 uses a General Software BIOS. To enter the CMOS you must press the <Del> key when prompted. The following CMOS screen shots indicate the CMOS options and the default factory values of each option. Note: These factory set options should not require changing.

# Changing the CMOS without Video

When running the board (Headless) without video, to enter the CMOS configuration you will need to plug in a keyboard, and a null modem serial cable to COM1. The CMOS configuration will then be redirected to the COM1 comport after pressing the delete key on the keyboard. This is done by pressing delete on the keyboard just after the keyboard lights flash (after keyboard initialization) and before the BIOS beep, following the board being powered up or reset. The CMOS configuration will be sent out COM1 at 9600 baud, 8 bits, no parity, one stop bit (9600-8-N-1).

Changes then can be made via HyperTerminal or any other serial terminal program.

Needed commands are:

CTRL-e	Move Up
CTRL-x	Move Down
TAB	Move Right
+	Toggle Selection Up
-	Toggle Selection Down
ENTER	Goto Selected Menu
ESC	Return to Main Menu/ Exit Without Saving

If a video card is present, hitting the delete key will take you directly into the BIOS setup screen and no serial port redirection will take place.

# **Optimizing the BIOS for Faster Boot Times**

There are several things that can affect the POST time of the board.

"Test Above 1 MB "	Disabling this option will give you 1-2 seconds faster boot depending on memory size
"BOOT ORDER: "	Setting the drive you primarily want to boot off of as the first drive will speed up the boot process
"DRIVE ASSIGNMENT"	This should be set to the correct information for the drives, for a Disk-On-Chip the hard drive does not need to be set, as the Disk-On-Chip's firmware will setup the drive as the last hard drive in the system. So to boot from the Disk-On-Chip with a Hard disk installed, set the hard drive to Drive D:
"IDE DRIVE GEOMETRY"	Without a Hard disk installed in the system, this option should be set to none. This keeps the BIOS from looking for a drive that is not installed.

# Appendix B

### Jumpers:

### JP1 – Manufacturing Test

For normal operation there should be 2 jumpers at positions A & B on JP1. Changing this jumper configuration will place the board in ELAN BIOS Safe mode and the system will no longer boot, this mode is for manufacturing processor testing.

### JP2 - DEBUG ENTER

This jumper is used for Manufacturing debug mode and should not be installed.

### JP3 - CMOS Clear & Real-Time Clock Reset

This jumper should be in the N or Z position for proper board operation. Placing the jumper in the O position will CLEAR the CMOS settings and RESET the Real-Time clock. Leaving this jumper placed in the O position will keep the board from booting because the Real-Time Clock will be held in RESET.

### JP4 - RS422/485 Enable

If this jumper is present, COM2 will be set to RS422/485. To transmit using RS422/485, RTS must be asserted, the receiver is always active. See the section on Serial Ports for additional RS422/485 information.
